

# Coloring and whitening

# Learning objectives

- ▶ Generate colored Gaussian noise using the Wiener-Khinchin theorem
- ▶ Estimate Power Spectral Density using Welch's method
- ▶ Learn how to whiten given data

# Colored Gaussian Noise

- ▶ See `NOISE/colGaussNoiseDemo.m`.
- ▶ In this script, we use the Wiener-Khinchin theorem

$$S_{out}(f) = S_{in}(f)|T(f)|^2$$

with

$$S_{in}(f) = \text{const. (White noise)}$$

and a filter with transfer function

$$T(f) = \sqrt{S_{out}(f)}$$

to generate colored noise having a PSD that approximates a target PSD

- ▶ The target PSD is

$$S_{out}(f) = \begin{cases} (f - 100)(300 - f), & f \in [100, 300] \\ 0, & \text{otherwise} \end{cases}$$

- ▶ The script generates 16384 samples of colored Gaussian noise with a sampling frequency of 1024 Hz

```
%% Demo for colored Gaussian noise generation
%Sampling frequency for noise realization
sampFreq = 1024; %Hz
%Number of samples to generate
nSamples = 16384;
```

Setting the sampling frequency and number of samples

```
%Target PSD given by the inline function handle
targetPSD = @(f) (f>=100 & f<=300).*(f-100).*(300-f)/10000;
freqVec = 0:0.1:512;
psdVec = targetPSD(freqVec);
```

Target PSD is a quadratic function of frequency in [100,300] Hz and zero outside this interval. Note that the highest frequency specified for generating the PSD is half the sampling frequency

```
fltr0rdr = 500;
outNoise = statgaussnoisegen(nSamples,[freqVec(:),psdVec(:)],fltr0rdr,sampFreq);
```

% Design FIR filter with  $T(f)$ = square root of target PSD

```
freqVec = psdVals(:,1);
sqrtPSD = sqrt(psdVals(:,2));
b = fir2(fltr0rdr,freqVec/(sampFreq/2),sqrtPSD);
```

Designing the filter with a transfer function:  $T(f) = \sqrt{S_{out}(f)}$

```
inNoise = randn(1,nSamples);
outNoise = sqrt(sampFreq)*fftfilt(b,inNoise);
```

Running the filter on iid Gaussian noise to generate colored noise

# Estimating PSD

- ▶ The script **NOISE/colGaussNoiseDemo.m** also plots an *estimate* of the PSD of the colored noise using the `pwelch` function in Matlab
- ▶ Note: `pwelch` produces a one-sided PSD while we designed the filter using a two-sided PSD
- ▶ Hence, there is a factor of 2 difference between the target and estimated PSDs
- ▶ The normalization in **NOISE/statgaussnoisegen.m** produces the correct two-sided PSD

```
% High default ;  
inNoise = randn(1,nSamples);  
outNoise = sqrt(sampFreq)*fftfilt(b,inNoise);
```

```
% Estimate the PSD  
% (Pwelch plots in dB (= 10*log10(x)); plot on a linear scale)  
[pxx,f]=pwelch(outNoise, 256,[],[],sampFreq);  
figure;  
plot(f,pxx);  
xlabel('Frequency (Hz)');  
ylabel('PSD');
```

# Colored Gaussian Noise

- ▶ Run the `NOISE/colGaussNoiseDemo.m` script
- ▶ Examine the target and estimated PSDs: Apart from overall normalization, the shapes should look similar
  - ▶ Note that the estimated PSD is obtained from a noise realization and, hence, has fluctuations in it
  - ▶ Increase the number of samples by factors of 2 and 4: examine the figures again
  - ▶ Why does the estimated PSD become smoother?
  - ▶ Enhance the script by putting axes labels, plot titles etc.
- ▶ Examine the noise **time series** by zooming in: Does it look like a WGN realization? How does it differ?
- ▶ Plot the histogram of the noise realization: Is it still a Normal PDF?

# Tasks

- ▶ You have been provided a plain text file: “testData.txt” in the **NOISE** folder:
  - ▶ First column: sampling times
  - ▶ Second column: data values
- ▶ The data contains:
  - ▶ A realization of colored Gaussian noise plus ...
  - ▶ A mystery signal added **after**  $t = 5.0$  sec
- ▶ You can load the data file using “load(‘testData.txt’)”: Matlab uses the file extension ‘.txt’ to recognize that this is a plain text file.
- ▶ Use the signal-free part of the data to:
  - ▶ **Estimate** the noise PSD
  - ▶ **Use the estimated PSD and emulate the code in NOISE/ statgaussnoisegen.m to design a whitening filter**
- ▶ Then,
  - ▶ **Whiten** the data
- ▶ **Plot** the **spectrograms** of the data before and after whitening
- ▶ **Plot** the **data time series** before and after whitening
  - ▶ Is the presence of the signal clearer in the data after whitening?
